SMART FSM

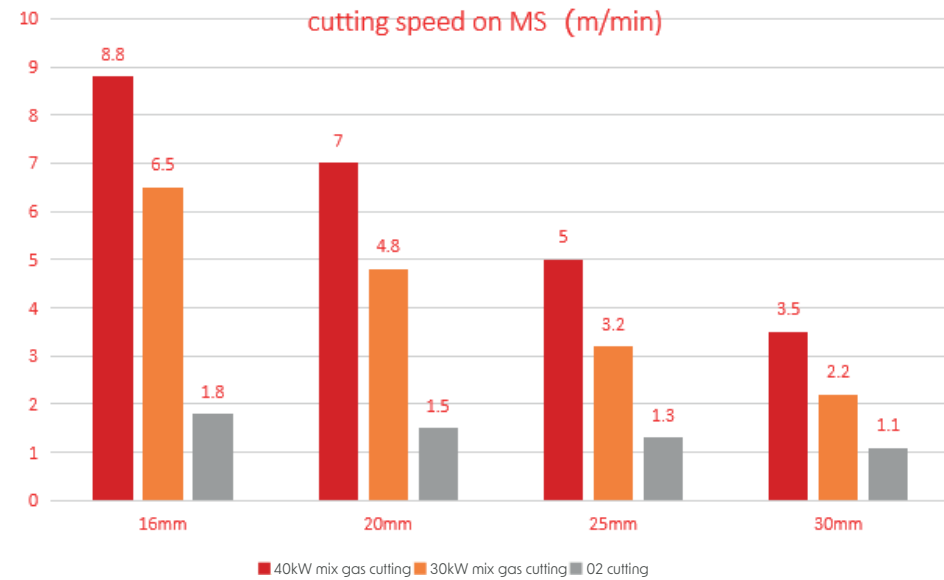

The evolution of gas mix from Cutlite Penta.

The last frontier of Cutlite Penta technology is here. Smart FSM is an internally developed component that improves the cutting process thanks to hardware technology controlled in real time by our Smart Manager software.

With just a few clicks, the right amount of oxidiser can be supplied, adapted for type and thickness. The result is incredible production performance, excellent finish and no calamine, without the need for bulky external equipment.

FSM technology uses technical nitrogen and oxygen gas systems, combining the right quantities via software in a safe, reliable and flexible way. A solution that makes it possible to efficiently produce parts to be painted and welded without further processing.

Thanks to FSM technology, it will not be necessary to make major changes to your nitrogen/oxygen system, and it is compatible with most Cutlite Penta machines already on the market.

Compared with the speed of ISOum 30KW-40KW cutting machine on MS, the mix gas cutting speed is significantly improved
